

DIY WIFI WIRELESS TEMPERATURE MONITORING KIT

The **Sensor Monitor HQ System** makes remote temperature management easy. Simply connect the wireless temperature sensors to your WiFi network and you can remotely monitor temperatures within fridges, freezers, coolrooms, wine cellars, rooms and much much more.

Each kit comes with a free online sensor management portal you can access from anywhere via the internet to check temperatures, receive alerts and retrieve temperature history logs.

Perfect for any industry where temperature monitoring is required. Your remote temperature monitoring will be up and running in minutes without any wiring giving you complete visibility from any web enabled device and instant alerts if temperatures are outside your pre-set limits.

This DIY kit includes two wireless temperature sensors, batteries and a USB programming cable - all you need with nothing more to pay.

Additional sensors are available if more than two required - there is no limit to how many sensors you can have.
